

User Story

Business Problem 1: The ERP systems are in the scope for the upgrade

Why

As a regional finance manager,

I want all 4 regional ERP systems consolidated into one integrated platform,

So that I can run consistent processes and reporting without reconciling data across separate regional systems.

Acceptance criteria

Given I am a user in any of the company's four regions,

When I log into the new ERP platform,

Then I should see the same core processes, data structure, and reporting tools as users in every other region,

And I shouldn't need to access any legacy regional system to complete my work

Business Problem 2: Security standards to be put in place

Why

As a compliance officer,

I want to see that a manager is not able to approve the same Purchase Order that was also initially created by him/her,

So that there isn't any conflict of responsibilities for someone to approve their own PO.

Acceptance Criteria

Given I am a compliance officer,

When I am trying to analyze any Segregation of Duties (SoD) issues in the system,

Then I need to receive notifications immediately and automatically if any such violations are performed,

And I shouldn't have to wait for the periodic manual monitoring to determine if a risky transaction has occurred.

Business Problem 3: Requirements for SOX controls to be put in place

Why

As a SOX compliance owner,

I want key financial controls to be automatically tested and evidenced within the ERP system,
So that I can demonstrate compliance without relying on time-consuming manual testing each reporting cycle.

Acceptance Criteria

Given I am a SOX compliance owner preparing for a controls testing cycle,
When a configurable financial control (e.g., three-way match, approval threshold) is executed in the system,
Then the system should automatically log evidence of that control being performed, including who, what, and when,
And I shouldn't have to manually pull and compile evidence from multiple systems to prove the control operated effectively.

Business Problem 4: Timeline for implementing the upgrade

Why

As a program sponsor,
I want a clearly defined, milestone-based implementation timeline across all four regions,
So that I can track progress and identify delays before they put the go-live date at risk.

Acceptance Criteria

Given I am a program sponsor reviewing project status,
When I check the program timeline at any point during the engagement,
Then I should see up-to-date milestone status (design, build, testing, UAT, go-live) for each region,
And I shouldn't have to request a manual status update from each regional team to know where the project stands.
